Motivation
Features of NDL SiPM Technology
Results
Conclusion
Motivation

- Scientific Researches, such as hadronic calorimeter (HCAL), electromagnetic calorimeter (ECAL), or SciFi tracker in high energy physics, need huge amount of SiPMs with large dynamic range, or highly resolved imaging with fewer readout channels.

SiPMs for CMS HCAL

LHCb SciFi tracker with 1-D pixel SiPM array [NIM A, 2017]
Features of NDL SiPMs

Features
- The bulk resistor under each APD cell in the epitaxial layer is used as the quenching resistors
- A continuous cap resistive layer at the surface to connect all the micro APD cells

Advantages
- Small micro cell, high micro cell density (thus large dynamic range) while retaining high fill factor and photon detection efficiency (PDE)
- No extra fabrication processes for quenching resistors are needed, thus simple fabrication technology and cost effective.
- Easy to implement charge division mechanism to realize a position-sensitive SiPM.
Results—Pulse Area Distribution and Gain

1 × 1 mm² NDL SiPM with pitch of 10 μm at 20°C
Results—Correlated Noise

- The scatter plot analysis and the histogram distribution versus the time interval for dark pulses of $1 \times 1$ mm$^2$ NDL EQR SiPM with pitch of 10 μm under 7 V overvoltage at 20$^\circ$C.
- The direct crosstalk probability and the delayed-correlated-noise probability was 7.7% and 3.6% respectively.
Results—Photon Detection Efficiency

- $1 \times 1 \text{ mm}^2$ NDL SiPM with pitch of 10 $\mu$m at 20°C.
  - (a) PDE measured by photon counting method at different overvoltage.
  - (b), (c) and (d) are measured by different methods at 420nm, 470nm and 530nm. The overvoltage are 7V.
Characterization of PDE

Photon Counting Method: based on counting photon response pulses of random low level light

\[
PDE(\lambda) = \frac{CR_{\text{total}}(\lambda) - DCR}{N_{in}} \times 100\% = \frac{(CR_{\text{total}}(\lambda) - DCR) \cdot R(\lambda) \cdot h \cdot c \cdot S_{\text{PIN}}}{I(\lambda) \cdot \lambda \cdot S_{\text{SiPM}}} \times 100\%
\]
Characterization Method

**Poisson Method:** According to the Poisson statistical principle, the average number of photoelectrons before and after illumination is obtained, so that the number of net photoelectrons is obtained, and PDE is obtained according to the following formula.

Average number of photons detected per pulse

\[ \mu = -\ln \frac{N_0}{N_{\text{total}}} \]

Average net photoelectron number

\[ \mu = \mu_{\text{light}} - \mu_{\text{dark}} = -\ln \frac{N_0}{N_{\text{total}}} + \ln \frac{N_{0\text{dark}}}{N_{\text{total}}} \]

Average number of incident electrons

\[ N_{\text{in}} = \frac{I_{\text{PIN}} \cdot \lambda}{R(\lambda) \cdot f \cdot h \cdot c} \cdot \frac{A_{\text{SiPM}}}{A_{\text{PIN}}} \]
The recovery time of $1 \times 1$ mm$^2$ NDL EQR SiPM with pitch of 10 μm obtained by performing the noise scatter plot analysis (left) and the fitting for pulse falling edge (right) is 2.2 ns.
Results—SPTR and Dynamic Range

- SPTR of NDL $1 \times 1 \text{ mm}^2$ SiPM with pitch of 10 μm is ~60 ps.
Double Light Superposition Method for Dynamic Range Calibration

**Features**

- To measure the intrinsic non-linearity of SiPM in a self-calibration way using the same test device without external calibration
- Compatible to characterize the recovery time

\[ MFPN = \frac{Q_{\text{light}} - Q_{\text{dark}}}{\Delta Q_{1\text{p.e.}}} \]

NDL 11-1010C SiPM Readout by KlauS ASIC

Provided by the KIP, Heidelberg University
KlauS5: A 36-channel low power silicon photomultiplier charge readout ASIC
Results--NDL PS-SiPM for high resolved imaging

Reconstruction of $9 \times 9$ incident light spot positions on the $2.77 \times 2.77 \text{ mm}^2$ of the device, with 5000 events at each position when MPEN is $\sim 3$. 
NDL has been developing an unusual SiPM technology. It employs bulk resistor under each APD cell in the epitaxial layer as the quenching resistors, and a continuous cap resistive layer at the surface to connect all the micro APD cells.

Its main advantages include:

- Small micro cell, high micro cell density (thus large dynamic range) while retaining high fill factor and photon detection efficiency (PDE)
- No extra fabrication steps for quenching resistors, thus simple fabrication technology and cost effective.
- Easy to implement charge division mechanism to realize a PS-SiPM.

It is very suitable for applications where high PDE while large dynamic range, or highly resolved imaging while fewer readout channels are simultaneously needed.

Conclusion
Thank You for Your Attentions!
