

Why does the Universe accelerate?

-Exhaustive study and challenge for the future, 2019.3.3

# Modeling Evolution of Dark Matter Substructure and Annihilation Boost

**Nagisa Hiroshima (Univ. of Tokyo & KEK)**

S.Ando (Univ. of Amsterdam & Kavli IPMU),

T.Ishiyama (Chiba Univ.)

公募研究「ガンマ線と大規模構造のクロス相関による暗黒物質粒子の探査」

研究代表者：安藤真一郎（アムステルダム大学, Kavli IPMU）

# Motivations

# WIMP dark matter

- Naturally explains the relic abundance with the canonical cross-section  
 $\langle\sigma v\rangle \sim 3 \times 10^{-26} \text{cm}^3 \text{s}^{-1}$

- WIMP DM mass should be

$$m_{\text{DM}} \sim \mathcal{O}(1)\text{GeV} - \mathcal{O}(1)\text{TeV}$$

- Gamma-ray observations are important.

**Only two model parameters.**

The Fermi-LAT, DES collaboration, 2016

# Subhalo in WIMP scenario

- WIMP scenario predict formation of small scale structures down to  $10^{-12} - 10^{-3} M_{\odot}$
- They should reside in larger halos (i.e., “subhalos”).

Ishiyama, Fukushige, Makino, 2008

**The existence of subhalos is expected.**

# The importance of subhalo

1. Subhalos contains information about the property of DM.

2. Subhalos on our lines-of-sight enhance the DM annihilation signal (**boost factor**):

$$\phi_{\gamma} = \frac{1}{2} \frac{1}{4\pi} \frac{\langle \sigma v \rangle}{m_{\text{DM}}^2} \int \frac{dN_{\gamma}}{dE_{\gamma}} dE_{\gamma} \cdot (1 + B) \int_{l.o.s} \rho_{\text{DM}}^2 ds$$

# DM search using cross-correlation

- The DM distribution should trace that of the galaxy
- Cross-correlation with nearby galaxies is an efficient probe.
- The constraints differ by a factor of  $\gtrsim 10$  depending on the boost models.

Ando, Benoit-Levy, Komatsu 2013

Ando, 2014

**We need to quantify the subhalo boost.**

# Estimates of subhalo boost

We need to cover

- $M_{\text{halo}} \sim 10^{-6} - 10^{16} M_{\odot}$
- $z \sim 0 - 10$

Previous works adopted extrapolation of results from numerical simulations:

$$\text{mass function } \frac{dN}{dm} \propto m^{-\alpha}$$

Sanchez-Conde & Prada, 2013

**We have developed a new analytical formalism!**

# Analytical Modeling

# The situation

3, Tidal Stripping

# Evolution of subhalos

1. Formation

2. Accretion

3. Tidal Stripping

EPS formalism

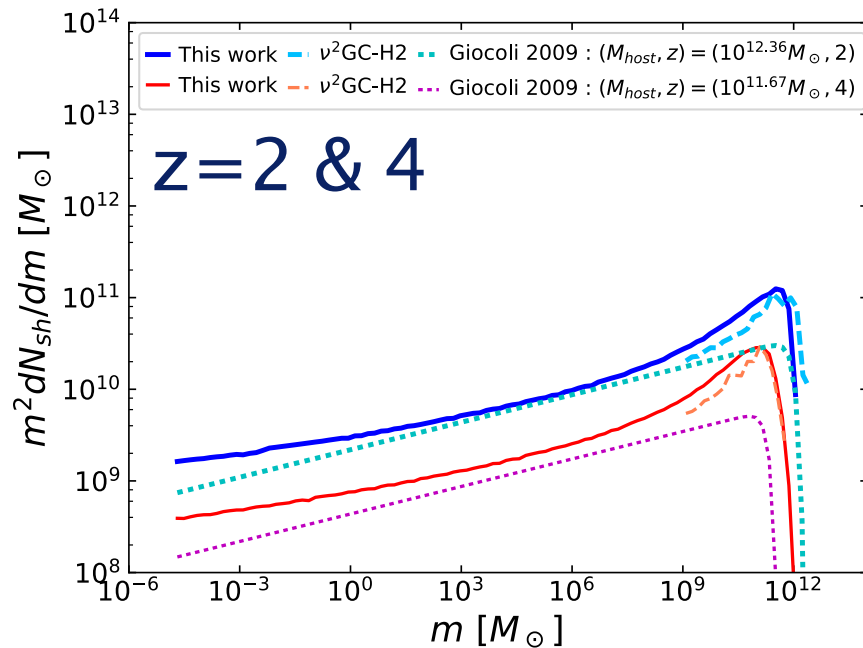

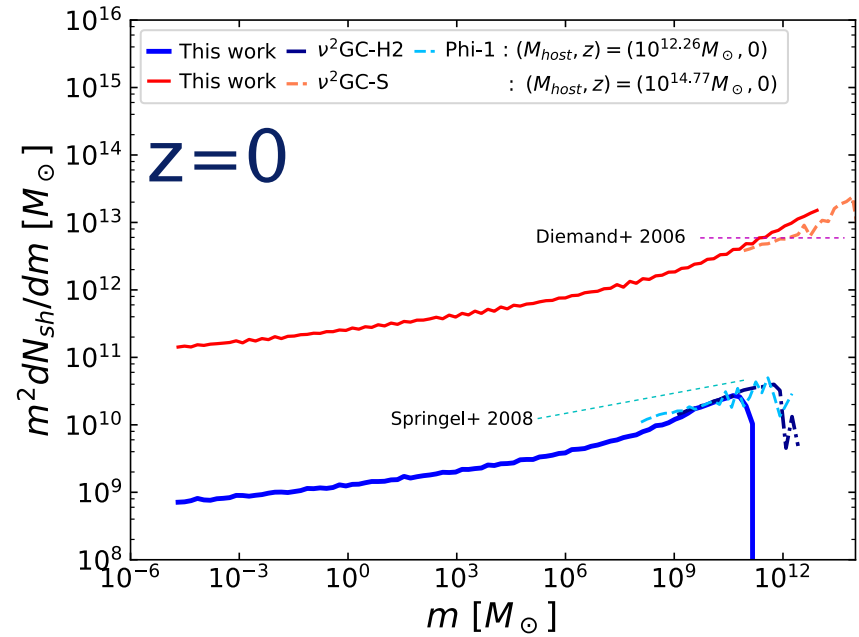

Assumptions:

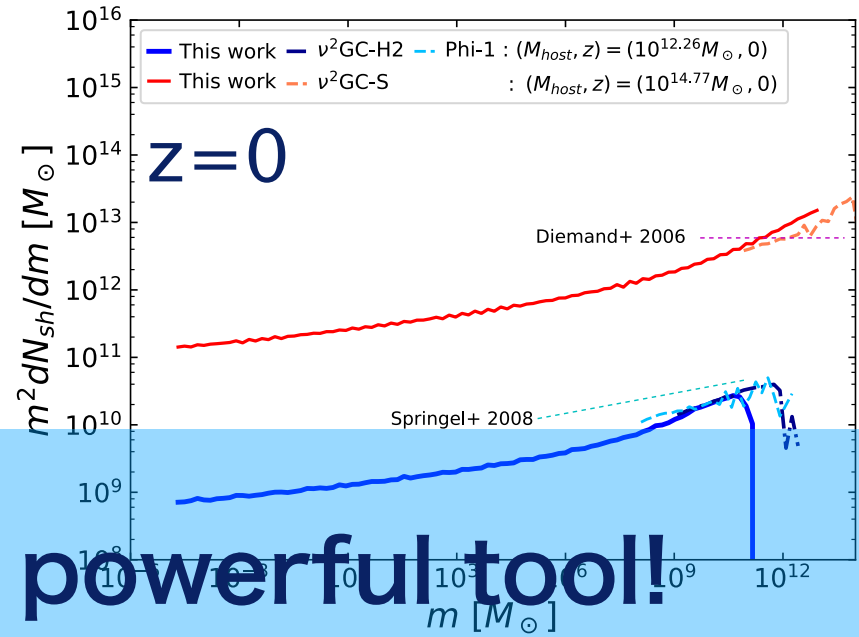

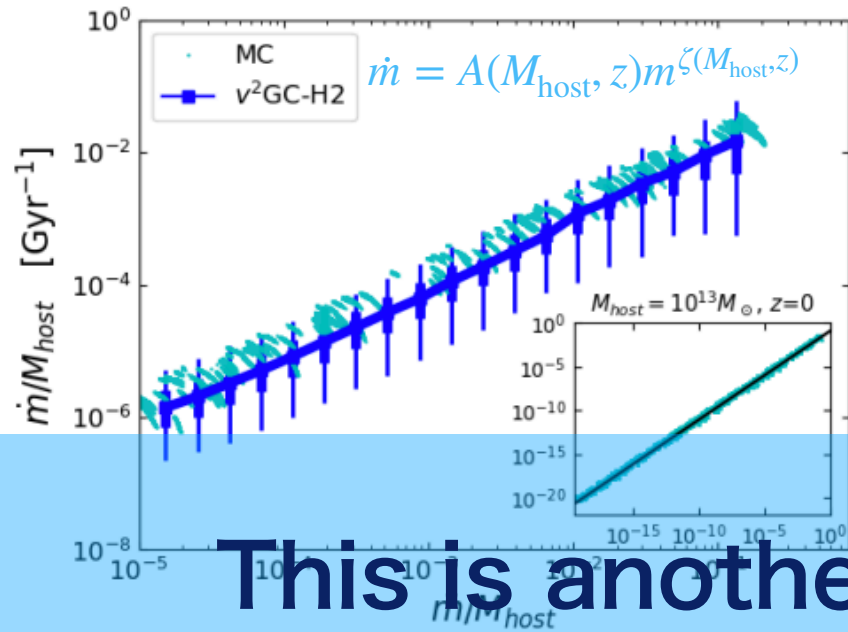

- NFW profile with truncation for host & subhalo
- mass-loss occurs in the first orbit of each subhalo

$$\dot{m} = \frac{m - m(r_t)}{T_r}$$

# The power of analytical calculations

# The power of analytical calculations

This is another powerful tool!

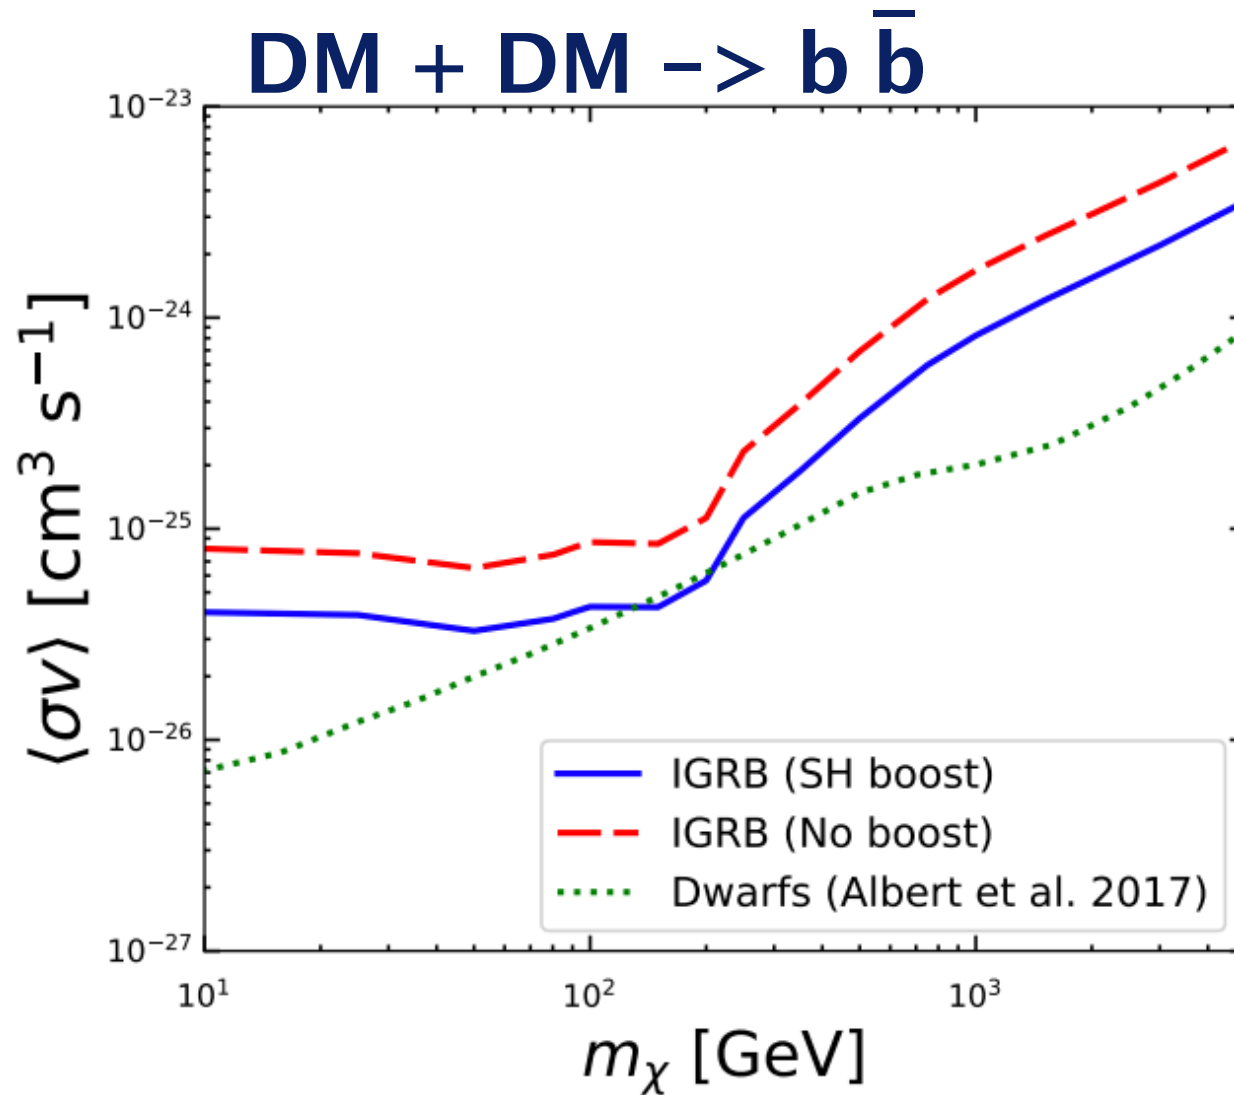

# Boost Factor

**Annihilation signal is boosted by factors**

# Update on IGRB limit

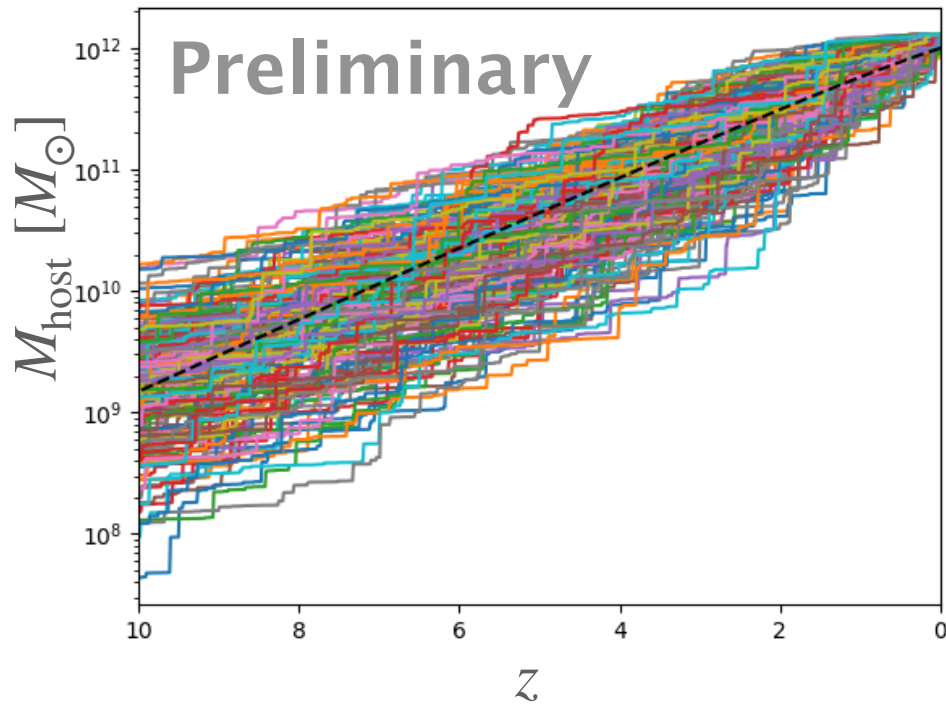

**Improving IGRB constraint**

# Extensions & Summary

# Implementation of the halo-to-halo scatter

evolution of the host

mass function

We can address many issues:

- too-big-to-fail problem
- microhalo search with PTA (Kashiyama & Oguri 2018)
- ...

# Summary

- **Precise understanding about the subhalo is important to search particle DM.**
- **We have developed an analytical formalism to follow the evolution of subhalos. The results agrees well with those of N-body calculations.**
- **DM annihilation signals can be boosted up to a factor of 10 in cluster scales**
- **We are now working on the further update to implement the halo-to-halo scatter.**
