# I'm trying to...

- figure out whether the late signals are the real signals or noise.
- I found the event numbers of the events with large TTs.
- I'm trying to extract the waveforms of corresponding events from the midas file.

# The problem is...

- The code (anaDisplay.cxx) resets and fills the histogram every time I click on the "next" button.
  - It doesn't save each histogram.
  - It doesn't loop over the events unless I click on the next button.
- I tried to check the waveforms by simply checking the oscilloscope.
  - The events I'm looking for has about 3 ns larger TT than the average ones.
  - The difference was too small to watch by eye.

# I'm going to...

- Try to rewrite the code so that it will loop over the events.
- If you have any idea, please let me know.
