Keio University School of Medicine, Tokyo, Japan

Malignant brain cancer : Glioblastoma

Cancer

A phenomenon in which normal cells change due to **gene mutations**, break the rules, proliferate abnormally, and survive for a long time.

Cancer cells **invade** surrounding organs or **metastasize** to distant organs, resulting in impairment of their functions.

Without treatment, various organ disorders eventually occur, leading to death.

How does cancer arise?

Normal skin structure

<http://www.kumc.edu/instruction/medicine/anatomy/histoweb/skin/skin.htm>

Normal tissue organization

Regulated cell proliferation, rapid turnover

Cancer cells are derived from stem-like cancer cells (cancer stem cells)

- Continuous growth
- Prolonged survival

**Critical mutation(s) in
a stem cell or a progenitor cell**

Cancer cells are derived from stem-like cancer cells (cancer stem cells)

Character of cell is determined by which genes are expressed

The combination of 23,000 gene expressions determines the nature of each cell

Cancer stem cells (CSC)

Structure of skin cancer

Cancer stem cells (CSCs)

CSC is resistant to conventional therapies

Therapeutic predictions of cancer stem cell model

Conventional cancer therapy

Anti-cancer stem cell therapy

What do we need for cancer eradication?

Targets

(cell, gene, protein
mRNA, signal etc)

Modalities

(small molecule,
nucleic acid, antibody,
peptide etc)

- **Novel therapeutic strategies for elimination of cancer stem cells**
- Detection of cancer stem cells in whole body
- Monitoring the cancer stem cells in patients treated by various therapeutic interventions

Therapeutic resistant mechanisms of cancer stem cells

- Resistant cells require **high energy production** (high ATP production) for survival and growth.
- High-energy-producing cells produce large amounts of **reactive oxygen species (ROS)**.
- Resistant cells have **anti-oxidant system** for survival.

Blocking the anti-oxidant system may induce cell death in the resistant cells

• Drugs Induce Ferroptosis in Cancer Stem Cells •

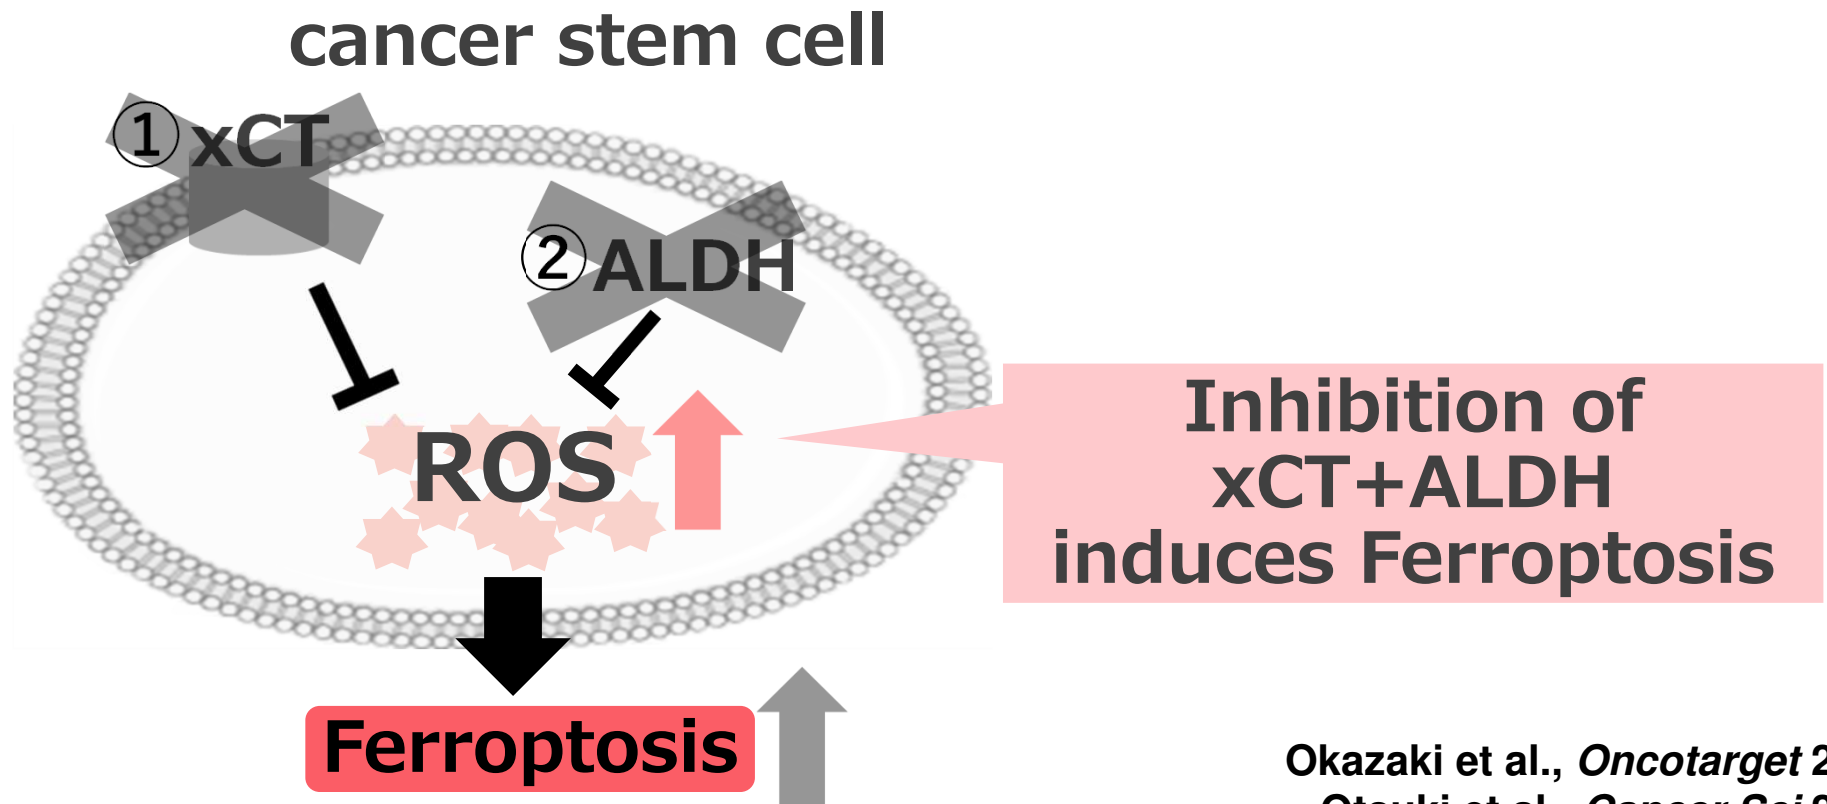

Two primary targets:
xCT and **ALDH** both collaborate to block oxidative stress

Okazaki et al., *Oncotarget* 2019

OIST Mini Symposium "New Medical Imaging and Advanced Cancer Therapy (BNCT) Instrumentation" May 14-16, 2015

Organizer: Hirotaka Sugawara, Advanced Medical Instrumentation Unit, OIST

Kavli IPMU-JAXA-Keio collaboration project

Whole body imaging of cancer stem cells and therapeutic resistant cells by applying the technologies of particle physics and space science

Technologies for space telescope are applied to microscope

March 26,
2018

Application of the most advanced space exploration sensors to medicine

Space exploration sensors may allow the detection of RI-labeled compounds incorporated in cancer stem cells.

High invasion ability of glioma iCSC

However, there is no way to detect a specific cancer cell population from outside the body without invasive procedures.

PET can detect approximately 1cm tumor which contains 10^9 cells.

Activities at Kavli IPMU

**Interdisciplinary approach
of applying cutting-edge technologies at the frontier of cancer research**

- Development of advanced gamma-ray imagers for Imaging of intratumoral heterogeneity with ultra-high spatial resolution ($\sim 100\ \mu\text{m}$)
- Studies of image-reconstruction algorithm (3D, Inverse Problem, Statistical Analysis of Big Data, Deep Learning)

**Activities include studies of
RI-labeled Molecules and Drug Delivery System**

- Designing and structural formula of chemical compounds for use in biological experiments
- Synthesizing radioisotope-labeled drugs
- Biological analyses using cells and small animals with

Conclusions

- Collaborative research to **detect heterogeneous cell groups** in tumor tissue **with 3D and multi-probe** using state-of-the-art space observation sensor technology has started.
- We intend to build a system that can **detect cancer cells with different properties in the living body at the single cell level** and rapidly evaluate the therapeutic effect.
- We intend to developed **a new THERANOSTICS** by loading RI into the specific probe.
