Measuring D_A using time-delay lenses

Paraficz & Hjorth (2009)

- Singular isothermal sphere (SIS) density profile
- ► Combine lensing dynamics (velocity dispersion) and the time-delay
- Measured the angular diameter distance using time delay Δt_{i,j}, velocity dispersion σ², lens redshift z_L and the image positions θ_i, θ_j

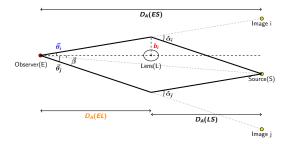

$$D_A(EL) = \frac{c^3 \Delta t_{i,j}}{4\pi \sigma^2 (1+z_{\rm L})} \frac{1}{(\theta_j - \theta_i)} \tag{1}$$

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Limitations

- ► Spherically symmetric mass distribution, isotropic velocity dispersion
- ► No study on the effect of the external convergence

Physical Intuition

When the mass distribution is known,

- $\blacktriangleright \text{ Time delay} \rightarrow \text{Mass estimate}$
- ► Velocity dispersion → Potential
- \Rightarrow Combine them to get the **physical size** (b) of the system

Observation of strong lensing arc gives the **angular size** (θ) of the system

San

 \Rightarrow The system can be used as a standard ruler to measure the **angular diameter distances** to the lens galaxy $(D_A(EL) = \frac{b}{\theta})$

Model

Mass density model

Spherically symmetric power-law density profile

External convergence

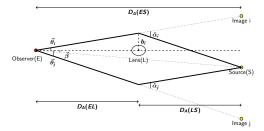

Mass-sheet transformation (MST)

Velocity dispersion model

- Anisotropic velocity dispersion
- Osipkov-Merritt anisotropy
- ► Aperture averaged vs. spatially resolved velocity dispersion

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Power-law density profile and the deflection angle

Density profile

$$\rho = \rho_0 \left(\frac{r}{r_0}\right)^{-\gamma} \tag{2}$$

Deflection angle at the lens plane

$$\hat{\alpha} = \frac{2GM(b)}{c^2 b} \frac{\sqrt{\pi} \Gamma[0.5(-1+\gamma)]}{\Gamma(\gamma/2)} \propto \sigma_r^2(b)$$
(3)

Scaled deflection angle

$$\vec{\alpha} = \hat{\alpha} \frac{D_A(LS)}{D_A(ES)} \tag{4}$$

Power-law density profile and the time delay

Time delay

$$\Delta t_{i,j} = \frac{(1+z_{\rm L})}{2c} \frac{D_A(EL)D_A(ES)}{D_A(LS)} \left[(\vec{\alpha}_i + \vec{\alpha}_j) \cdot (\vec{\theta}_i - \vec{\theta}_j) - \frac{2}{3-\gamma} (\vec{\alpha}_i \cdot \vec{\theta}_i - \vec{\alpha}_j \cdot \vec{\theta}_j) \right]$$
$$= \frac{(1+z_{\rm L})}{2c} D_A(EL) \left[(\hat{\alpha}_i + \hat{\alpha}_j) \cdot (\vec{\theta}_i - \vec{\theta}_j) - \frac{2}{3-\gamma} (\hat{\alpha}_i \cdot \vec{\theta}_i - \hat{\alpha}_j \cdot \vec{\theta}_j) \right]$$
(5)

 \Rightarrow The angular diameter distance becomes

$$D_A(EL) = \frac{c^3 \Delta t_{i,j}}{4\pi \sigma_r^2(r)(1+z_{\rm L})} (\Delta \tilde{\theta}_{i,j})^{-1}$$
(6)

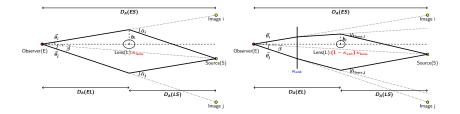

where $\Delta \tilde{\theta}_{i,j}$ is a function of θ_i , θ_j and γ .

Mass-sheet transformation : properties

Convergence transformation via MST

K

$$\kappa_{\text{lens}} \rightarrow \kappa_{\text{MST}} = \kappa_{\text{ext}} + (1 - \kappa_{\text{ext}})\kappa_{\text{lens}}$$
 (7)

Scaling lens convergence results in

$$\vec{\alpha}_{\text{model}} \rightarrow \vec{\alpha}_{\text{MST}} = \kappa_{\text{ext}} \vec{\theta} + (1 - \kappa_{\text{ext}}) \vec{\alpha}_{\text{model}}$$

$$\vec{\alpha}_{\text{lens}} \rightarrow \vec{\alpha}_{\text{MST,lens}} \equiv (1 - \kappa_{\text{ext}}) \vec{\alpha}_{\text{lens}}$$

$$\hat{\alpha}_{\text{lens}} \rightarrow \hat{\alpha}_{\text{MST,lens}} = (1 - \kappa_{\text{ext}}) \hat{\alpha}_{\text{lens}}$$
(8)

▲□▶ ▲□▶ ▲臣▶ ▲臣▶ 三臣 - のへで

Mass-sheet transformation : effect

Time-delay after the MST

$$\Delta t_{i,j,\text{MST}} = (1 - \kappa_{\text{ext}}) \Delta t_{i,j}$$
(9)

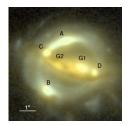

Velocity dispersion after the MST

$$\sigma_{\rm MST}^2 = (1 - \kappa_{\rm ext}) \,\sigma^2 \tag{10}$$

 $\Rightarrow D_A(EL) \propto \frac{\Delta t}{\sigma^2}$ invariant under the MST!

No need to model the external convergence!!

Uncertainty on D_A

B S D A G C N

Figure: B1608+656

Figure: RXJ1131-1231

Tests on B1608+686 & RXJ1131-1231

(Data and figures from Suyu et al. 2010 & Suyu et al. 2013, and references therein, respectively)

- Uncertainties from γ and $\Delta t_{i,j}$ are negligible
- Velocity dispersion is the biggest source of uncertainty
- Uncertainty on D_A is $\sim 13 14\%$ with current data
- Potential estimation (velocity dispersion) seems to play an important role: How to take into account the anisotropic velocity dispersion?

Anisotropic velocity dispersion : modeling

Osipkov-Merritt anisotropy

$$\beta_{\rm ani}(r) = \frac{r^2}{r_{\rm a}^2 + r^2} = 1 - \frac{\sigma_T^2(r)}{\sigma_r^2(r)}$$
(11)

- Anisotropy parametrization : $r_{\rm a} = nR_{\rm eff}$
- Isotropic core & radial envelope

Jeans equation

$$\frac{1}{\rho_*}\frac{d(\sigma_r^2\rho_*)}{dr} + 2\beta_{\rm ani}\frac{\sigma_r^2}{r} = -\frac{GM(\leq r)}{r^2}$$
(12)

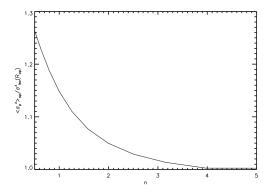

Projection & luminosity weighting (Hernquist profile)

$$\sigma_p^2(R) = I_H(R)\sigma_s^2(R) = 2\int_R^\infty (1 - \beta_{\rm ani} \frac{R^2}{r^2}) \frac{\rho_*(r)\sigma_r^2(r)rdr}{\sqrt{r^2 - R^2}}$$
(13)

Aperture-averaged velocity dispersion

Measured velocity dispersion is luminosity-weighted, aperture-averaged

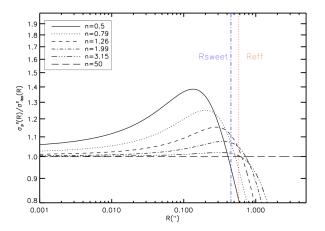

$$\langle \sigma_{\rho}^{2} \rangle_{\rm ap} \equiv \frac{\int_{\rm ap} \sigma_{s}^{2} I_{H} R \ dR \ d\theta}{\int_{\rm ap} I_{H} R \ dR \ d\theta}$$
(14)

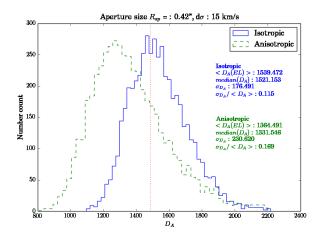

The velocity dispersion varies significantly due to the anisotropy!

Sweet-spot method

Radius where the scatter in anisotropic velocity dispersion is minimized

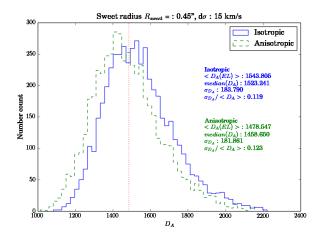

Monte-Carlo simulation 1: D_A measured at $\langle \sigma_p^2 \rangle_{ap}$

Anisotropic velocity dispersion biases the distribution, and the width of the distribution is increased

・ロト ・ 母 ト ・ ヨ ト ・ 日 ト ・ 日 ト

Monte-Carlo simulation 2: D_A measured at $\sigma_p^2(R_{sweet})$

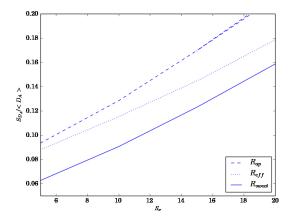

Anisotropic velocity dispersion does not bias the distribution, and the width of the distribution does not change significantly

・ロト ・ 母 ト ・ ヨ ト ・ 日 ト ・ 日 ト

Expectation

Uncertainties on measured velocity dispersion [km/s] vs. the fractional uncertainty on D_A inferred

~ 7% precision is achievable with 5% precision measurement on σ^2 from a single system!

Э

Summary

- Strong lens with time delay can be used as a standard ruler to measure the angular diameter distances to the lens
- The external convergence cancels out : The main source of uncertainty in measuring the time-delay distances is not there
- ► The biggest uncertainty on *D_A* is from the velocity dispersion and its anisotropy
- Using spatially resolved velocity dispersion profile at the sweet spot radius will improve the precision

< ロ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

- More studies on anisotropy parametrization are required
- arXiv:1410.7770 for more details!

Discussion

- Preciseness & accuracy of time-delay measurement (e.g. Liao et al. 2014)
- Possibility of spatially resolved velocity dispersion profile and its accuracy (e.g. Agnello & Suyu)
- ► Defining "effective" convergence
- Uncertainty caused by focusing at the lens plane due to the external convergence
