## Probing the hot CGM by combining eROSITA with DESI and 4MOST

*Monday, 8 April 2024 17:05 (25 minutes)*

In this presentation, in a first part, I review the current measurements of the hot CGM carried out on eROSITA using the galaxy samples from SDSS and GAMA. Then I discuss the potential of combining the next-level spectroscopic surveys (4MOST and DESI) with the latest eROSITA observations to measure the properties of hot CGM.

In a second part, I discuss the challenges encountered in modelling hot CGM observations and how to solve them with a forward modelling approach leveraging hydro-dynamical simulations.

**Presenter:** COMPARAT, Johan
