

Gamma-ray observation of SN axion conversion in stellar magnetic field

with Claudio Andrea Manzari, Benjamin R. Safdi, and Inbar Savoray

Yujin Park
Berkeley Week, 2024

Axions

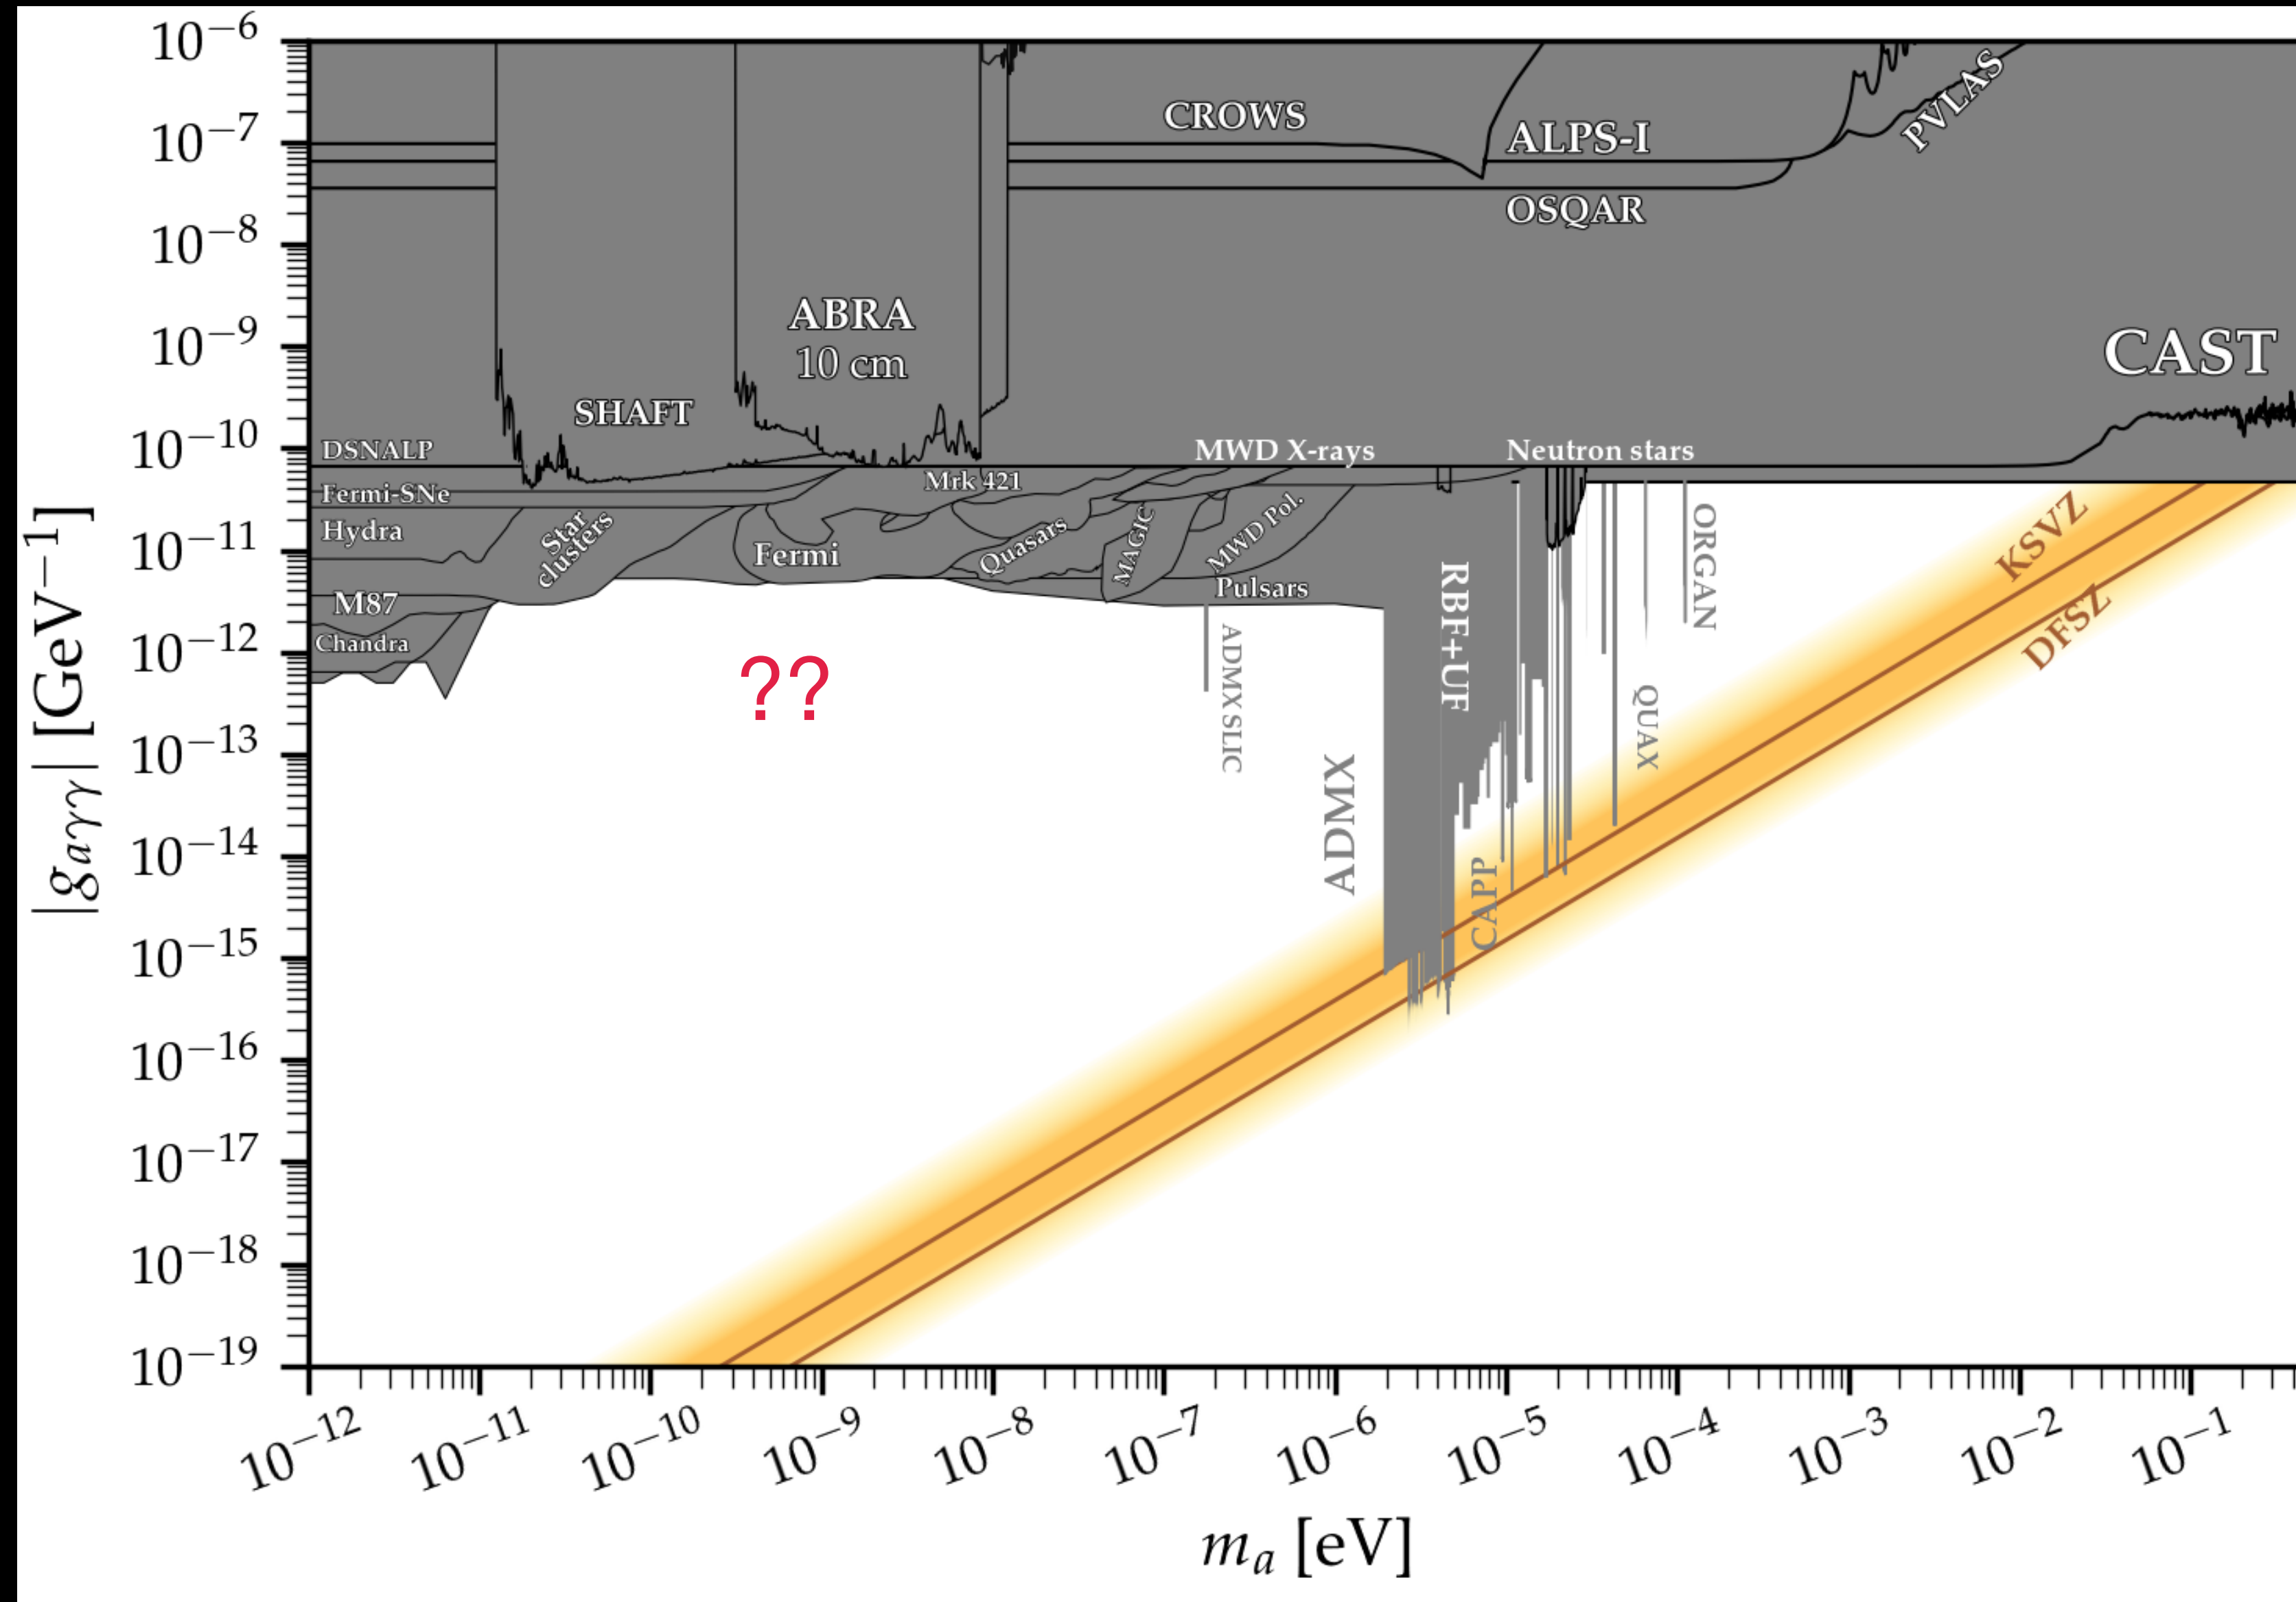

- Light pseudoscalar boson with a two-photon coupling
- Addresses the strong CP problem
- Dark matter candidate
- Additional theoretical motivation in quantum gravity and string theory

$$\mathcal{L} \supset \frac{1}{4} g_{a\gamma\gamma} a F_{\mu\nu} \tilde{F}^{\mu\nu} = g_{a\gamma\gamma} a \mathbf{E} \cdot \mathbf{B}$$

Galactic Magnetic Field

IllustrisTNG

10 kpc

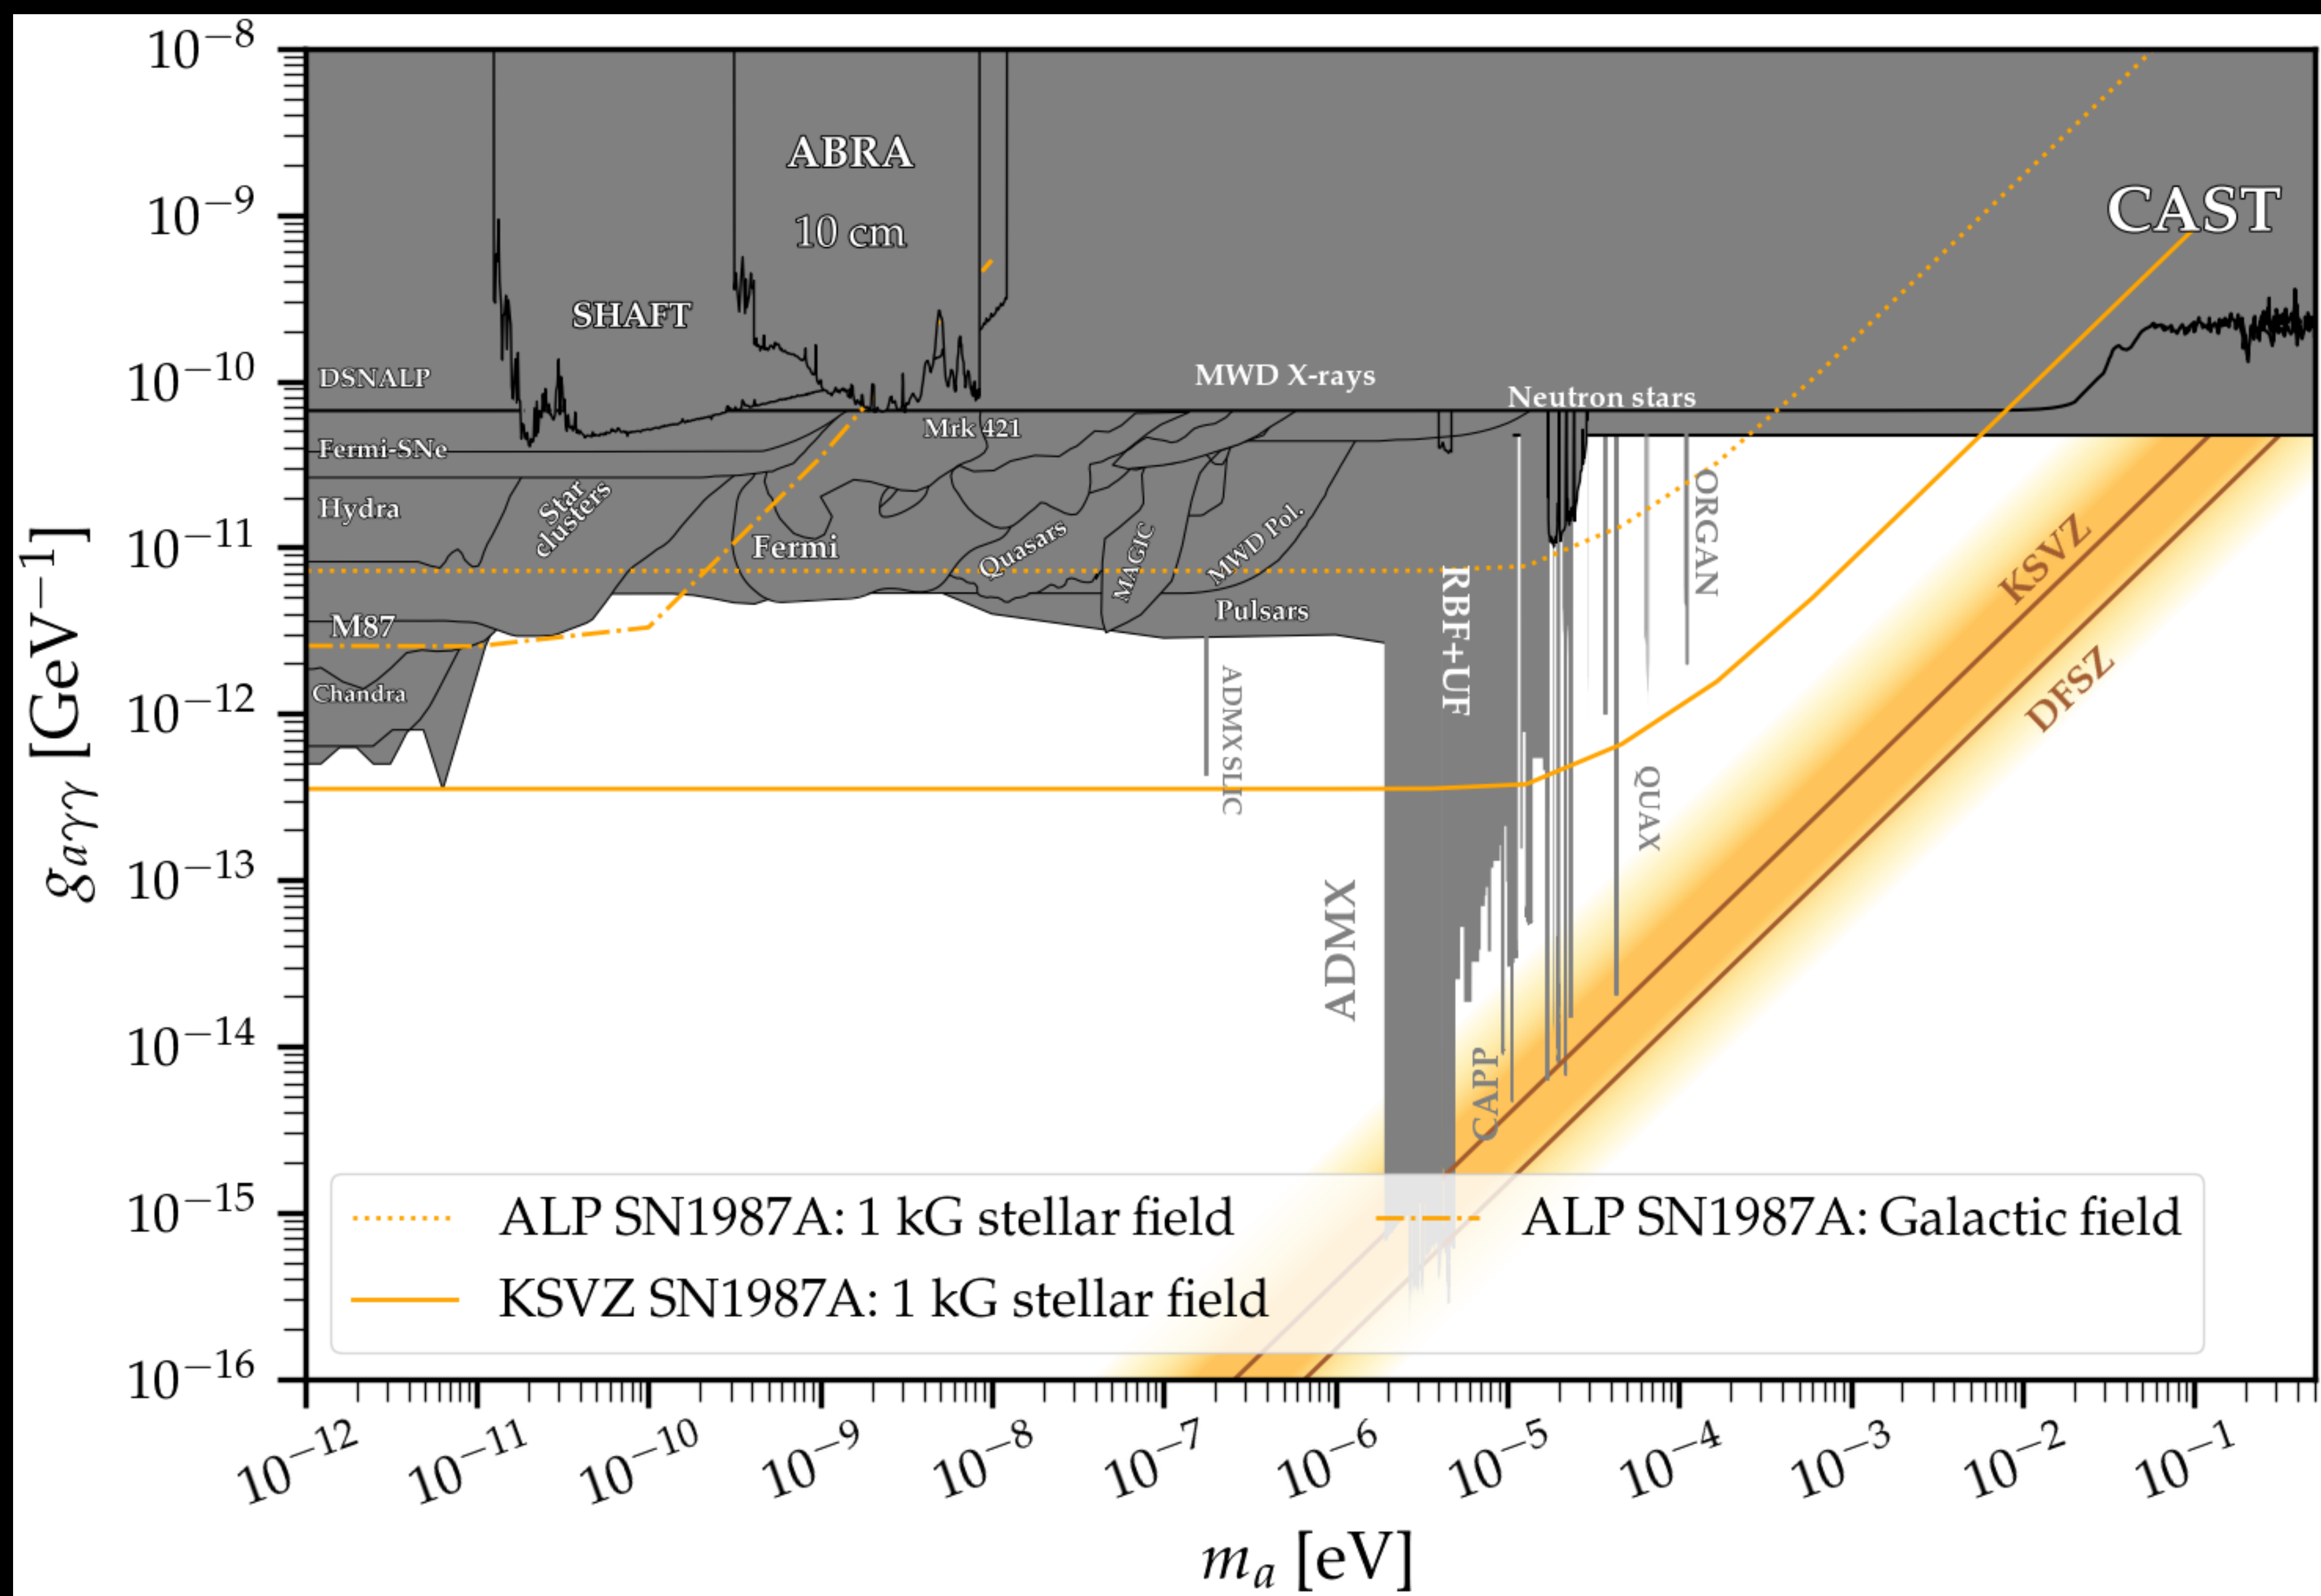

$\log M_* = 11.3$
 $z = 0, \text{ID} = 372754$

Stellar Magnetic Field

- Model as dipole magnetic field
- Field strength at stellar mid-plane fixed to 1kG

Future Supernova

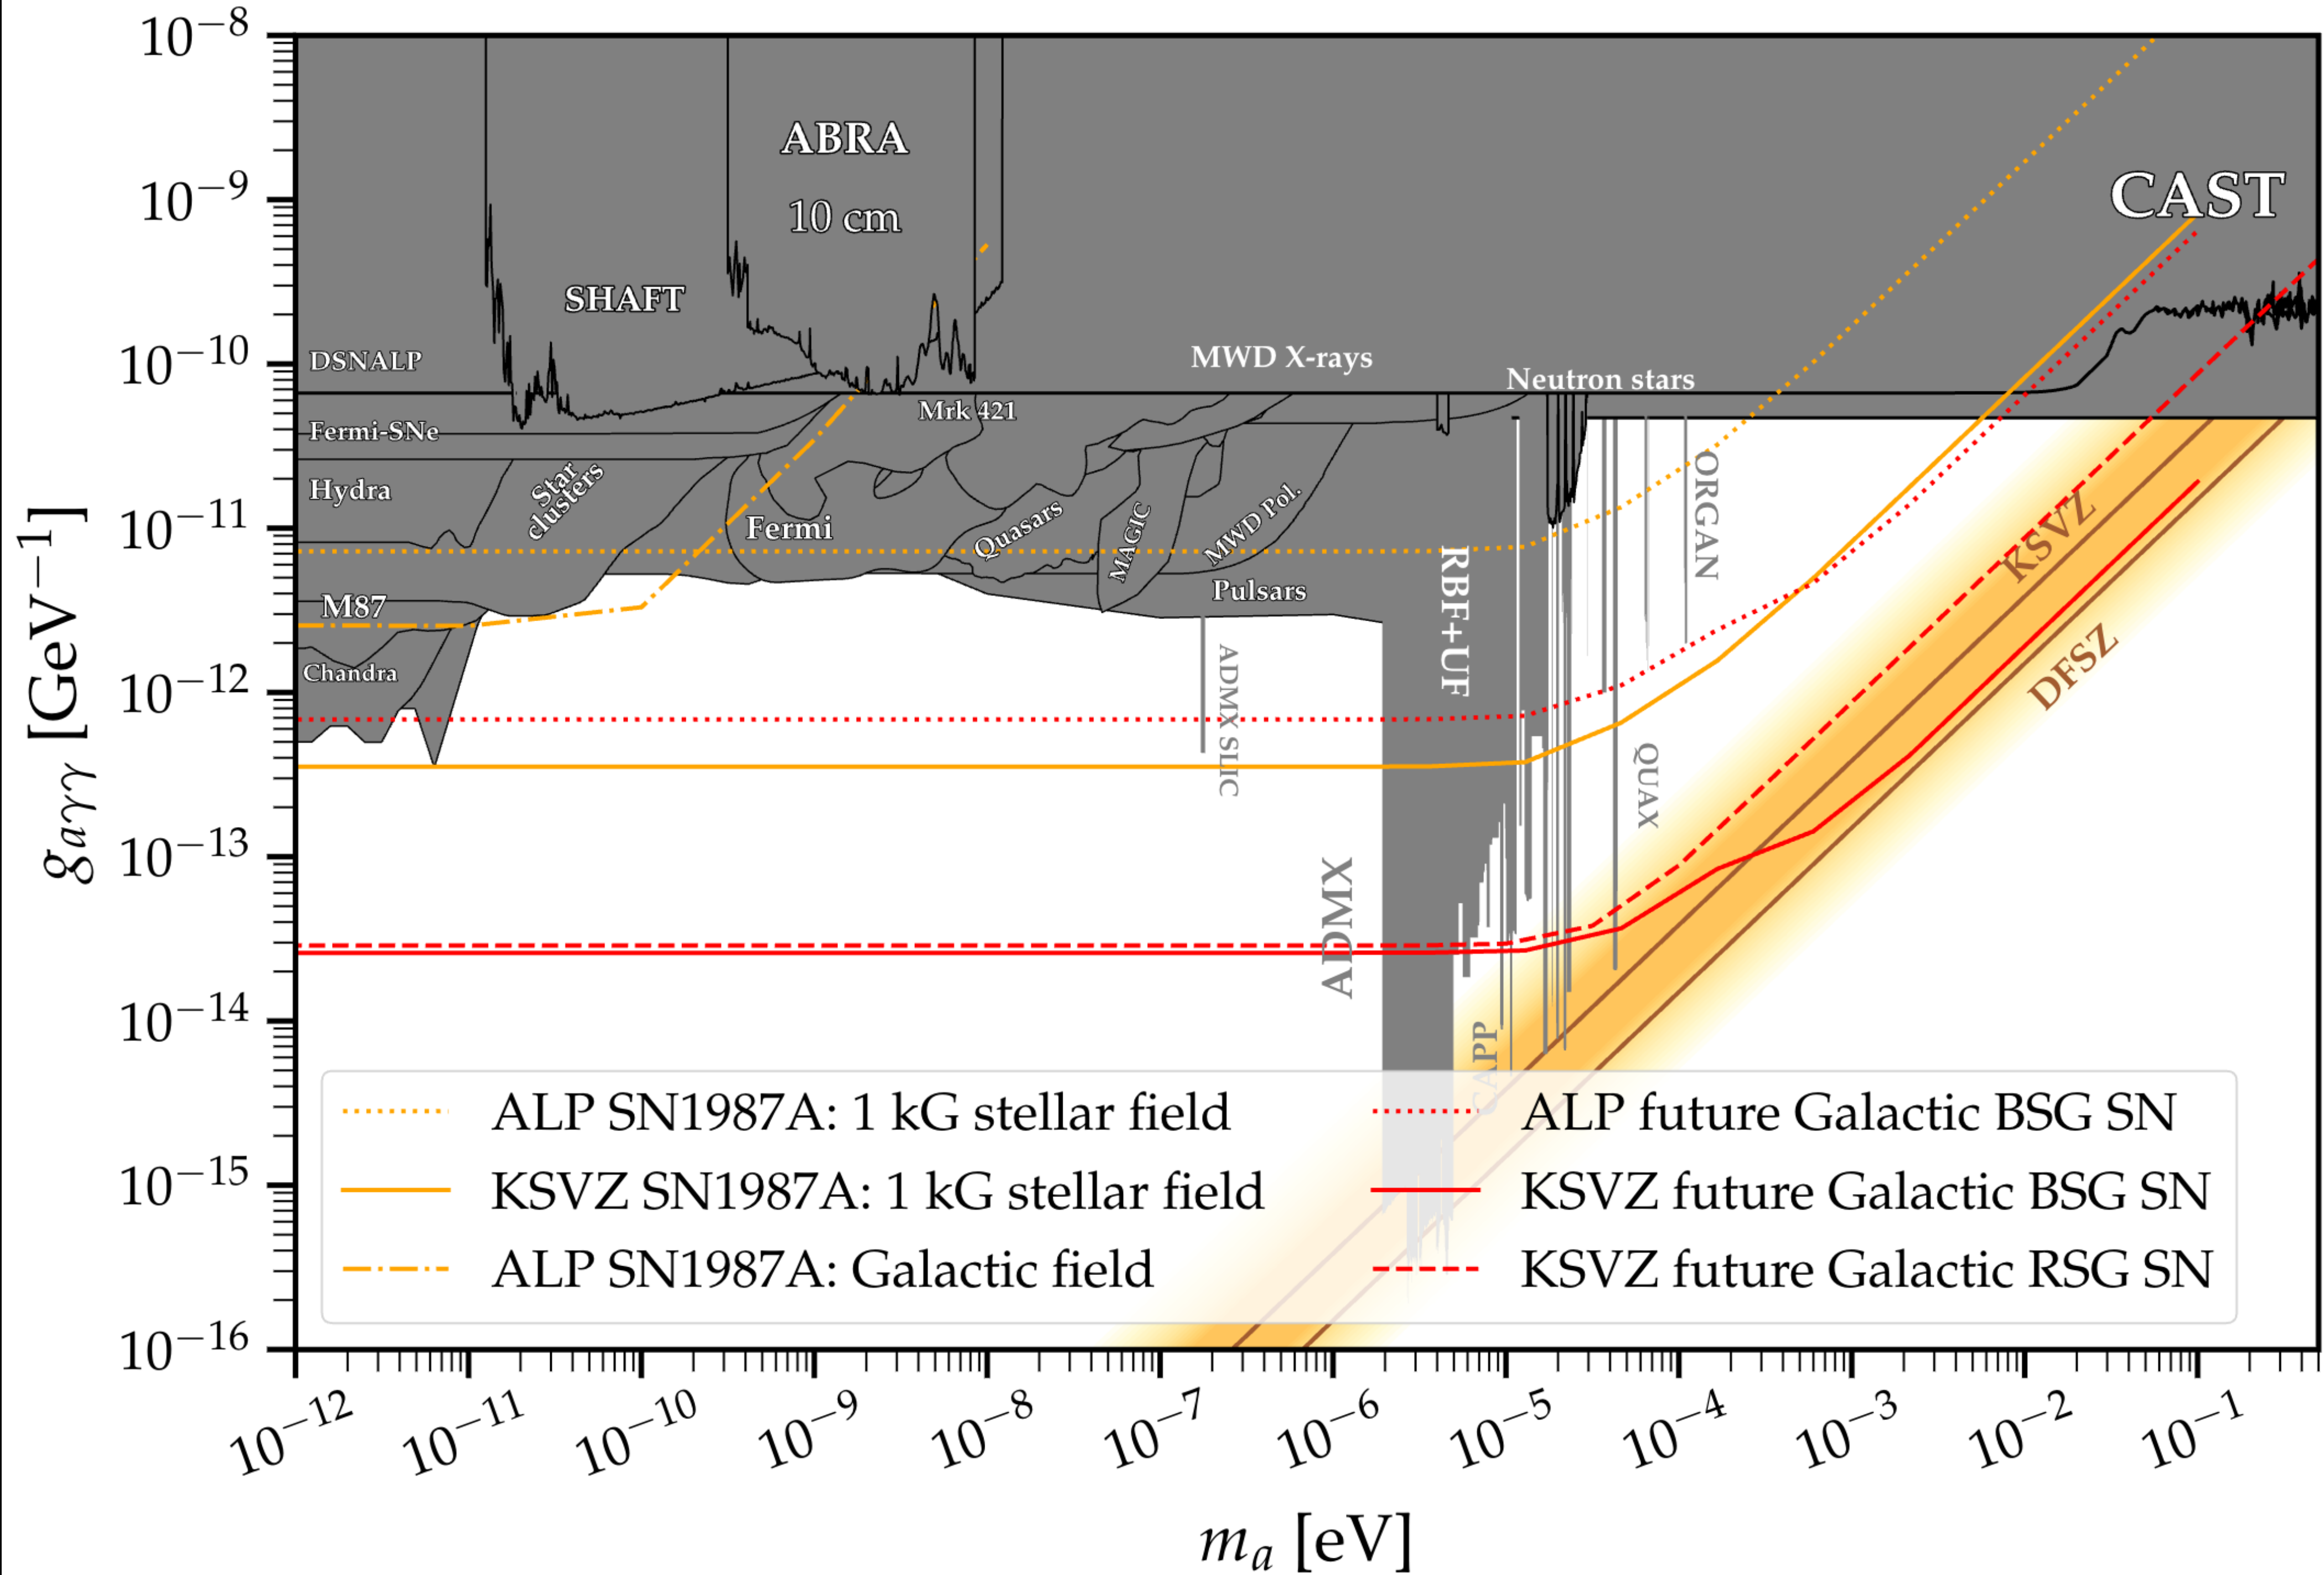

- Galactic supernova rate : 1 in every ~100 yrs
→ could occur very soon!
- Would we observe this?
→ **unlikely** due to Fermi-LAT observing portion of the sky at a time

Future Supernova

Pion conversion is above ~ 100 MeV which increases the observable signal for future observation

Proposal

Full-Sky constellation of SmallSats for continuous,
full-sky $\sim 100\text{-}500$ MeV gamma-ray detection

Conclusion

- New method of axion conversion in progenitor magnetic field
- Projected limits of Fermi-LAT observation of a supernova
- Proposal for gamma-ray telescope array with constant full-sky coverage
